PART OF SOUTHERN CALIFORNIA SHOWING AREA DESCRIBED IN THIS AND PREVIOUS BULLETINS OF THE NO. 91 SERIES

ABSTRACT

This bulletin is one of a series on water wells and springs in southern California desert areas. The series is prepared by the U.S. Geological Survey and published by the California Department of Water Resources.

Each bulletin locates water wells and springs in a part of the southern California desert regions; describes well depth and yield, water use and level on dates observed; names the well owner; provides pumping data, including depths, rates, static water levels, drawdowns, and specific capacities; and lithologic data from drillers' well logs.

Earlier bulletins in the series are:

Bulletin No. 91-1: Data on Wells in the West Part of the Middle Mojave Valley Area, San Bernardino County, California. June 1960; 126 p. [Out of print]

Mr. William R. Gianelli, Director
Department of Water Resources
State of California--Resources Agency
Post Office Box 388
Sacramento, California 95802

Dear Mr. Gianelli:

We are pleased to enclose, for publication by the Department of Water Resources, the U.S. Geological Survey report on "Water Wells and Springs in the Western Part of the Upper Santa Margarita River Watershed, Riverside and San Diego Counties, California," by F. W. Giessner, B. A. Winters, and J. S. McLean.

This report--one of a series of data reports on southern California--was prepared by our Garden Grove subdistrict office, in accordance with the cooperative agreement between the Riverside County Flood Control and Water Conservation District and the U.S. Geological Survey. It tabulates all available data on wells and springs in the indicated area and contains maps showing the location of wells and springs and the reconnaissance geology with special reference to the water-yielding deposits.

Very truly yours,

R. Stanley Lord

R. Stanley Lord
District Chief

Previous Investigations and Acknowledgments

Data on ground water in the western part of the upper Santa Margarita River watershed are contained in U.S. Geological Survey Water-Supply Papers 338 and 429; State of California, Department of Water Resources Bulletins 39-57, 39-58, 39-59, 39-60, 39-61, 39-62, 130-63, 130-64, 130-65, 106-2; and State of California Department of Public Works, Division of Water Resources written communication "Office Report on Investigation of Hexavalent Chromium Waste Discharge, Murrieta, Riverside County" (1956).

The geology was compiled and modified by J. S. McLean, B. A. Winters, and F. W. Giessner from maps by Mann (1955) and Engel (1959), and an unpublished map by Fred Kunkel (1961).

The Riverside County Flood Control and Water Conservation District provided access to all pertinent information in its files. The Rancho California provided data as did many private well owners and well drillers. The cooperation and assistance of those who contributed materially to the completeness of the data in this report are gratefully acknowledged.

Purpose and Scope of the Investigation

The data in this bulletin were collected by the U.S. Geological Survey, in cooperation with the Riverside County Flood Control and Water Conservation District, as a phase of the investigation of water wells and springs and general hydrologic conditions throughout much of southern California.

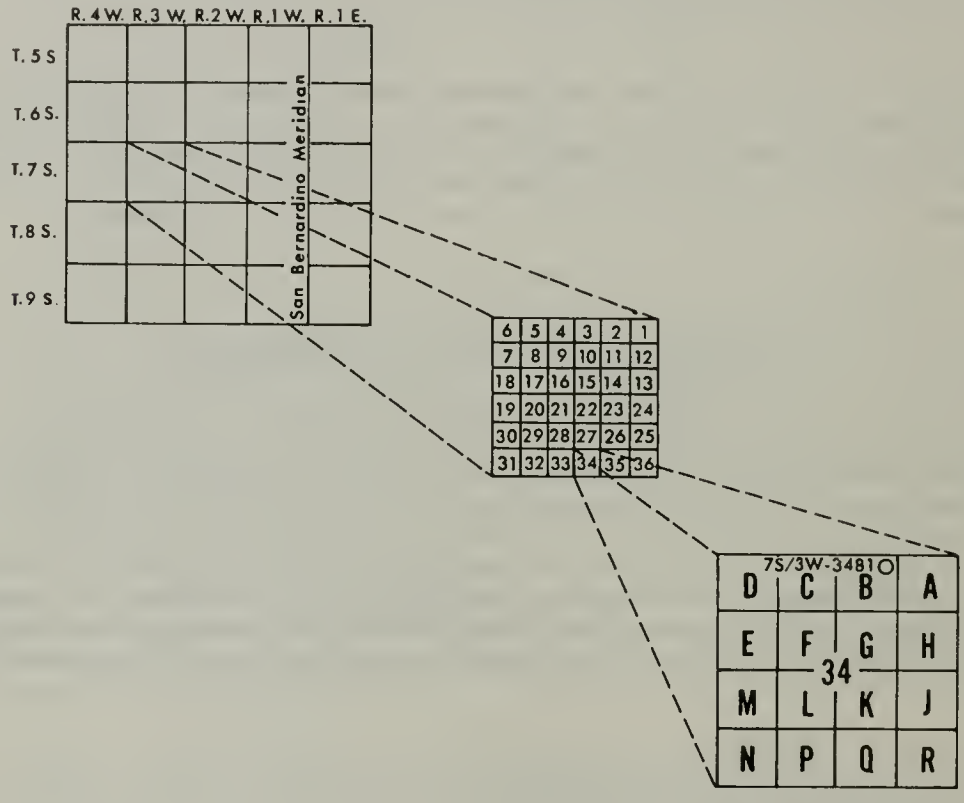
The general objective of the investigation is to collect and tabulate all available ground-water data for the individual basins in order to provide public agencies and the general public with data for overall ground-water investigation of the area and for planning water utilization and development work.

The scope of the work includes (1) brief reconnaissance of major geologic features to determine the extent and general character of the deposits that contain ground water; (2) field examination of most water wells and springs in the area to determine their location with respect to the geographic and cultural features and the public-land net and to record well depths and sizes, types and capacities of pumping equipment, uses of the water, and other pertinent information available at the well site; (3) measurement of the depth to water below land surface; (4) selection of representative wells to be measured periodically to detect and record changes of water level; and (5) collection and tabulation of well records, including well logs, water-level measurements, chemical analyses, and pumping-test data.

The work was done intermittently between 1967 and 1970 by the Water Resources Division of the Geological Survey, under the general supervision of R. Stanley Lord, district chief for California, and under the immediate supervision of L. C. Dutcher and J. L. Cook, successive chiefs of the Garden Grove subdistrict.

Well- and Spring-Numbering System

Wells and springs are numbered according to their location in the rectangular system for the subdivision of public land. For example, in the number 7S/3W-34B1, the part of the number preceding the slash indicates the township (T. 7 S.), the part between the slash and the hyphen indicates the range (R. 3 W.), the number between the hyphen and the letter indicates the section (sec. 34), and the letter indicates the 40-acre subdivision of the section. Within the 40-acre tract wells are numbered serially, as indicated by the final digit. Thus, well 7S/3W-34B1 is the first well to be listed in the NW1/4 NE1/4 sec. 34, T. 7 S., R. 3 W., San Bernardino base line and meridian as shown in the diagram below:



Where a Z has been substituted for the letter designating the 40-acre tract, the Z indicates that the well is plotted from unverified location descriptions; the indicated sites of such wells were visited, but no evidence of a well could be found.

Springs are numbered similarly except that an S is placed between the 40-acre subdivision letter and the final digit as shown in the following spring number: 6S/1W-5LS1.

GENERAL FEATURES

The western part of the upper Santa Margarita River watershed area covers about 260 square miles in the southwestern part of Riverside County; a small part of the area lies in northwestern San Diego County. The area is approximately between long 116°57' and 117°17' W., and lat 33°25' and 33°42' N.

The area includes all or part of the following valleys: Auld, Diamond, Domenigoni, French, Glen Oak, Long, Pauba, Temecula, Tucalota, and Wolf. The principal towns are Temecula, Murrieta, and Wildomar. Access to the area is by U.S. Highway 395 and California Highway 71.

The area described is shown on all or parts of the following topographic quadrangle maps: Elsinore, Romoland, Winchester, Hemet, Wildomar, Murrieta, Bachelor Mountain, Sage, Temecula, Pechanga, and Vail Lake at a scale of 1:24,000.

GEOLOGIC AND HYDROLOGIC FEATURES

The geologic units of the western part of the Santa Margarita River watershed are divided into two broad categories: consolidated rocks and unconsolidated deposits.

The consolidated rocks include the metamorphic and igneous rocks of pre-Tertiary age. These rocks form the basement complex that underlies the unconsolidated deposits. Also included in the consolidated rocks are volcanic rocks, of Tertiary and Quaternary age.

The basement complex includes the Bedford Canyon Formation, the Bonsall Tonalite, the Domenigoni Valley Granodiorite, the Lakeview Mountain Tonalite, the San Marcos Gabbro, and the Woodson Mountain Granodiorite. The basement complex locally yields small quantities of water to wells from joints and fractures.

The volcanic rocks, of Tertiary and Quaternary age, are not considered as a source of ground water. They are composed of the Santa Rosa Basalt, of Pliocene(?) age, and the Nigger Canyon Volcanics, of Pleistocene age, both of Mann (1955). The Santa Rosa Basalt consists of mesa-forming olivine-basalt flows which form Mesa de Colorado and Mesa de Burro. The Santa Rosa Basalt overlies the Martinez(?) Formation of Mann (1955), of Paleocene(?) age. The Martinez(?) consists of well-cemented arkose and arkosic gravel. On the geologic maps it is undifferentiated from the Santa Rosa Basalt. The Nigger Canyon Volcanics consist of tuff, agglomerate, dikes, and basalt flows.

The unconsolidated deposits consist of sedimentary material deposited during Quaternary time. These deposits have been subdivided into older and younger alluvium and form the principal aquifers in the area.

The older alluvium consists of boulders, gravel, sand, silt, clay, and lacustrine deposits. Included in the older alluvium are the Pleistocene Temecula Arkose, the Pauba Formation, and the Dripping Springs Formation, all of Mann (1955). The Temecula Arkose consists principally of white or buff sand and brown silt; calcareous concretions and lime-cemented beds are also common. The Pauba Formation consists of coarse, reddish, poorly consolidated fanglomerate with interbedded sand and silt. These formations where saturated yield water to wells. The Dripping Springs Formation consists of a thin veneer of alluvial fan material in the Vail Lake area. This formation is not extensive, and it is not considered a source of ground water.

The younger alluvium of Holocene age consists of boulders, gravel, sand, silt, and clay. Where saturated, these deposits yield water freely to wells.

Recharge to the ground-water system occurs by infiltration of precipitation and infiltration of runoff during flooding. Ground-water movement after recharge is generally westward toward the bedrock gorge near Temecula where it rises to the surface forming the Santa Margarita River. The river flows through Temecula Canyon and eventually discharges into the Pacific Ocean.

A complex system of northwest-trending faults locally impedes the movement of ground water. Associated with the fault system are hot springs such as those at the resort areas of Murrieta and Temecula.

TABLE 1.--*Description of wells and springs*

[Boxhead explanations are abstracted from U.S. Geological Survey "Instructions for Using the Punch-Card System for the Storage and Retrieval of Ground-Water Data"]

State well number: The wells are identified according to their location in the rectangular system for the subdivision of public land. The identification consists of the township number, north or south; the range number, east or west; and the section number. The section is further subdivided into sixteen 40-acre tracts lettered consecutively (excepting I and O), beginning with A in the northeast corner of the section and progressing in a sinusoidal manner to R in the southeast corner. Wells within the 40-acre tract are numbered sequentially. The base line and meridian are indicated by the final letter, as follows: H, Humboldt; M, Mount Diablo; S, San Bernardino.
Spring number: Springs are numbered similarly. However the letter S is added after the 40-acre tract letter to differentiate the spring from a well.

Owner or user: The apparent owner or user on the date indicated. In some cases, the local name of the well or spring is given.

Ownership:

- C County
- F Federal Government
- M City, town, or unincorporated village
- N Corporation or company, churches, lodges, and other nonprofit, nongovernment groups
- P Private
- S State agency
- W Water district.

Use of water:

- A Air conditioning
- B Bottling
- C Commercial
- D Dewatering
- E Power generation

Altitude of lsd: Altitude of land-surface datum, in feet, above mean sea level. Land-surface datum is an arbitrary plane closely approximating land surface at the time of the first measurement and used as the plane of reference for all subsequent measurements.

Water level: Depth to water, in feet, above(+) or below land-surface datum.

Date measured: Month and year of the water-level measurement; other data given generally apply for this date.

Yield of well (or spring): Yield, in gallons per minute; drawdown, in feet.

TABLE 2. *Records of water level*

Letter(s) following water-level measurements:

A Well being pumped.
B Well pumped recently.
C Nearby well being pumped.
D Nearby well pumped recently.
E Estimated.
F Dry.
G Measurement by outside agency or person.
H Tape measurement (recorder).
I Affected by outside influence (wind, atmospheric pressure, ocean tides, railroad trains).
J Water level below sea level.
K Measurement from recorder chart.
M Obstruction in well above water surface.
N No measurement.
O Measurement discontinued.
P Well destroyed.
Q Flowing.

Ran core barrel from 60 feet 9 inches to 66 feet 9 inches. Formation cored fine sand with silt, which ran out of core barrel before it reached the surface. Bit sample on core barrel showed clay and silt with small pebbles and sand. Bit sample at 90 feet showed fine micaceous clay and silt, containing particles of decomposed granite.

TABLE 5.--*Pumping tests*

Time: Time of measurement, in minutes, after pump was started.

Static water level: The depth to water, in feet below or above (+) land-surface datum, prior to start of test.

Pumping water level: The depth to water, in feet below or above (+) land-surface datum, at end of test.

Drawdown: The difference, in feet, between the static and pumping water levels.

Yield: The yield of the well, in gallons per minute, for drawdown indicated.

Specific capacity: Yield, in gallons per minute, divided by drawdown, in feet. The specific capacity is a measure of the physical condition of the well and the aquifer or aquifers which it penetrates. A well with a large specific capacity is capable of a greater yield than a well with a small specific capacity.

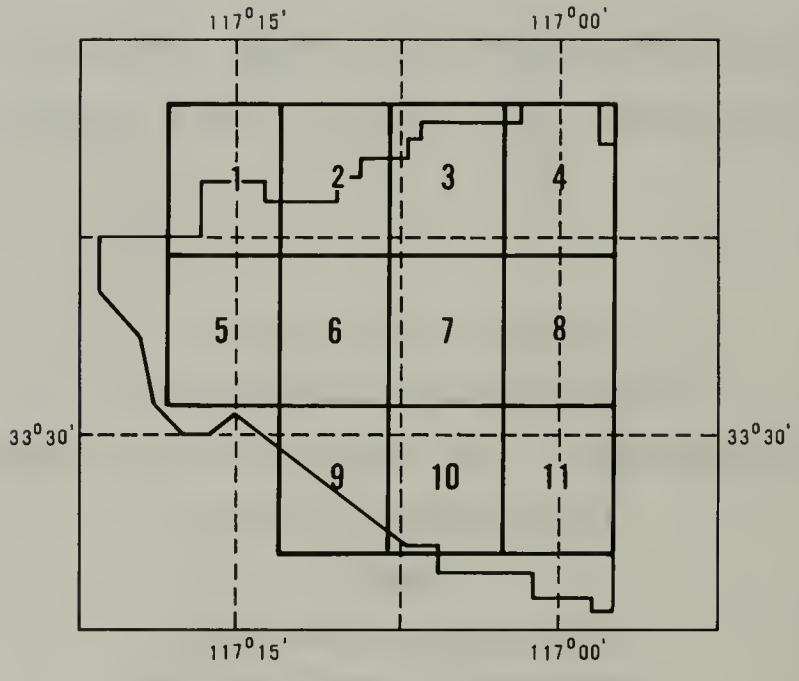
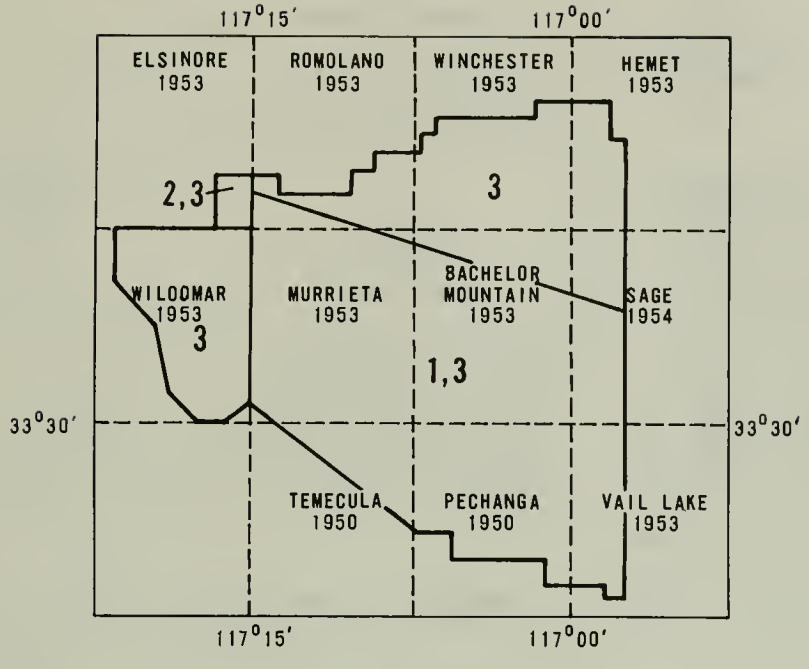
1970

This section consists of explanatory information, 11 page-size maps, and three insets that show generalized geology and location of wells and springs in the western part of the upper Santa Margarita River area. The area covered by each individual map is shown below. One composite map, about 34 x 38 inches, is available on request, at the requester's expense, from the district chief, U.S. Geological Survey, Water Resources Division, 855 Oak Grove Avenue, Menlo Park, California 94025.





INDEX TO TOPOGRAPHIC MAPS AND GEOLOGIC MAPPING

Geology compiled and modified by J.S. McLean, B.A. Winters, and F.W. Giessner, from published and unpublished mapping

1. J.F. Mann, Jr. (1955)
2. Rene Engel (1959)
3. Fred Kunkel (unpublished 1961)

Location of wells and springs by J.S. McLean and B.A. Winters

Base from U.S. Geological Survey topographic quadrangles, Scale 1:24,000

EXPLANATION

UNCONSOLIDATED DEPOSITS

Holocene

Qya

Younger alluvium

Boulders, gravel, sand, silt, and clay. Where saturated, yields water freely to wells

Pleistocene

Qoa

Older alluvium

Boulders, gravel, sand, silt, clay, and some lacustrine deposits. Includes the Dripping Springs Formation, the Pauba Formation, and the Temecula Arkose, all of Mann (1955). Where saturated, yields water to wells

QUATERNARY

CONSOLIDATED ROCKS

QTv

Volcanic rocks

Olivine basalt flows, reddish brown. Principally the Santa Rosa Basalt of Mann (1955), of Pliocene(?) age; also includes the sedimentary Martinez(?) Formation of Mann 1955), of Paleocene(?) age, near Mesa de Burro and the Nigger Canyon Volcanics of Mann (1955), of Pleistocene age, near Vail Lake. Not considered a source of ground water

TERTIARY AND QUATERNARY

pTb

Basement complex

Igneous and metamorphic rocks. Includes the Bedford Canyon Formation, the Bonsall Tonalite, the Domenigoni Valley Granodiorite, the Lakeview Mountain Tonalite, the San Marcos Gabbro, and the Woodson Mountain Granodiorite. Yields small quantities of water from joints, fractures, and weathered zones

PRE-TERTIARY

MAP SYMBOLS

Approximate geologic contact

Fault

Dashed where inferred, dotted where concealed; queried where doubtful

Surface-water divide

E1
Well equipped with a 5-hp motor or larger

A1
Unused well or well equipped with a motor smaller than 5-hp

C1
Dry or destroyed well

AS1
Flowing spring

BS1
Dry spring

WELL-NUMBERING SYSTEM

Letter after well indicates position in section thus:
